CARDIOTHORACIC SURGEON

William Yarbrough, MD  
CARDIOTHORACIC SURGEON

Michael Foster, MD  
INTERVENTIONAL CARDIOLOGIST

J. William Phillips, MD  
INTERVENTIONAL CARDIOLOGIST

Providence Health provides a safe, minimally invasive option for patients with symptomatic aortic stenosis who may be considered high or intermediate risk for traditional surgery. The procedure is called Transcatheter Aortic Valve Replacement (TAVR).

TAVR delivers a prosthetic valve to the calcified aortic valve through a catheter-type device. Once deployed into place, the sides of the synthetic valve hold the compromised leaflets open, and the new valve begins to regulate blood flow without having to remove any portions of the existing tissue.

As the first facility in the Midlands with this technology, our TAVR team has been successfully performing this procedure longer than any other provider in the area. “Providence Heart & Vascular Institute has a history of leadership in cardiovascular care in the Midlands,” said J.P. Sutton, surgeon and clinical lead for the TAVR program. “We are proud to have been the first to improve quality of life and reduce mortality risk for patients in the Midlands who previously could not have been treated.”

Qualified patient candidates are now being accepted for evaluation.
If you are a physician with a patient suffering from severe aortic stenosis and need to refer your patient for TAVR consideration, or if you are a patient who would like more information, please contact Providence Health’s Advanced Valve Care team at 803.409.7164 or email AVC@providencehospitals.com.
